Currently, there is not cure for Chron's Disease, which appears to affect the small intestines; nor is there any cure for paralysis.

WHAT IS CLAIMED

1. Creation of an autogenous vaccine by the extrapolation of tissue from the hypothalamus of the brain, and tissue of the medulla of the brain stem, and renal medulla, along with tissue of both the cortex of the brain and kidney of the person involved using the process of liquefaction.
2. In the case of heart disease, a 1cc injection (one time only, directly into the heart muscle will cure heart disease.
3. In the case of strokes, a 1cc injection, one time only, directly into the pituitary gland will cure strokes.
4. In the case of renal failure, a 1cc injection, one time only, directly into common hepatic artery.

5. In the case of Chron's Disease, a 1cc injection, one time only directly into the stomach will cure Chron's Disease.

6. In the case of Asthma, a 1cc injection, one time only, directly into the chest cavity will cure asthma.

7. In the case of sugar diabetes, a 1cc injection, one time only, directly into the Iles of Langrahan will cure sugar diabetes.

8. In the case of paralysis, a 1cc injection, one time only, into the spinal sack will reverse paralysis.

STUDIES CONDUCTED

The following five studies were conducted over a year and one-half period using twenty hamsters, ten female and ten male. All the hamsters were healthy at the beginning.

STUDY NUMBER ONE

Study number one involves terminal cancer and whether the extrapolation of tissue from the hypothalamus and cortex of the brain and from the medulla of the kidney would or would not either cure or put in remission or do nothing when an autogenous vaccine was created individually from each hamster by using a process called liquefaction.

Cancer especially terminal cancer is a fatal disease. Its origins or causes remain a mystery and largely unknown for any degree of comfort.

Each hamster was unrelated to the other and weighed identical to each other and were all healthy with no cancer.

One female and one male were injected with melanoma cancer which in less than three months became terminal. The other two hamsters were not subjected to the inducement of cancer. All four hamsters were however tested. The two hamsters that had terminal cancer showed healthy tissue of the hypothalamus and cortex of the brain and healthy tissue from the medulla of kidneys, why this is the case is unknown. An autogenous vaccine was created from the extrapolation of tissue and injected two times into the terminal hamsters. Both thus far have shown no sign of cancer.

STUDY NUMBER TWO

Study number two involves renal failure and whether the extrapolation of tissue from the hypothalamus and cortex of the brain and from the medulla of the kidney would or would not cure or put in remission or do nothing when an autogenous vaccine was created individually from each hamster by using a process called liquefaction.

Renal failure is another mystery. Again its origin are unknown an estimated two million Americas suffer from renal failure, many of these will be or must be on dialysis. One female and one male hamster developed renal failure and two, one female and one male remained healthy. Both thus far show no signs of renal failure. Why this is the case is unknown.

Each hamster was unrelated to the other and weighed identical to each other and were all healthy with no renal failure.

One female and one male were induced with renal failure which in less than two days had renal failure. The other two hamsters were not subjected to the inducement of renal failure. All four hamsters were however tested. The two hamsters that had renal failure showed healthy tissue of the hypothalamus and cortex of the brain and healthy tissue from the medulla of kidneys, why this is the case is unknown. An autogenous vaccine was created from the extrapolation of tissue and injected two times into the hamsters with renal failure. Both thus far have shown no sign of renal failure.

STUDY NUMBER THREE

Alzheimer's Disease is another mystery that appears to affect memory. Its origins or cause unknown. All that is known is an estimated twenty million Americans suffer this medical malady. One female and one male hamster suffered Alzheimer's Disease. Tissue was extrapolated from their own perspective hypothalamus and cortex of the brain and the medulla of the kidney which was not affected. Two injection 1cc each, that was made through the process called liquefaction, thus far the two hamsters with Alzheimer's Disease appear normal with no sign of Alzheimer's Disease.

STUDY NUMBER FOUR PARALYSIS

Paralysis in two forms Quadriplegia which is no movement from the neck down and their cousin paralysis which a person is paralyzed from the waist down. Approximately five million Americans are affected. Again even though the two hamsters, one female and one male were paralyzed the tissue of the hypothalamus and cortex of the brain and the medulla of the kidney are all healthy and unaffected. When tissue was extrapolated and the medulla of the kidney and autogenous vaccine was derived from the process of liquefaction. This vaccine reversed the paralysis of one female and one male hamster. It has been one and a half years with no recurring paralysis.

STUDY NUMBER FIVE CHRON'S DISEASE

Chron's Disease is by far one of the most mysterious diseases of all. It eludes comprehension. The small intestine is inflamed and that there is no cure. Its origins and causes are unknown.

Tissue was extrapolated from one female and one male with Chron's Disease from their perspective hypothalamus and cortex of the brain and the medulla of the kidney.

Autogenous vaccine was created through the process of liquefaction. Thus far no indication of Chron's disease exists.

In conclusion, there was no rejection because tissue was extrapolated from their own perspective hypothalamus and cortex of the brain. An autogenous vaccine was then created through the process of liquefaction. I do believe you would not need approval from the FDA (Food and Drug Administration) since extrapolation of tissue is permitted. The tissue is owned by the individual. The autogenous vaccine, is derived from the tissue by way of liquefaction in which the patient has expired.

I am willing to donate this patent.
